What Does Eagle Crusher Do?

Eagle Crusher makes equipment that crushes rocks. The crushers handle rocks from quarries, concrete from building demolition, and asphalt from roads. Eagle makes the crushers in Bucyrus, OH and has offices in Galion, OH.

AGGREGATES ASPHALT CONCRETE EAGLE IMPACTOR JAW MAGNET RECYCLING ROCK CRUSHER Crushers take large pieces of rock in quarries and crush them down into smaller rocks, or AGGREGATES. Those aggregates can then be turned into sand, gravel, concrete, and more!

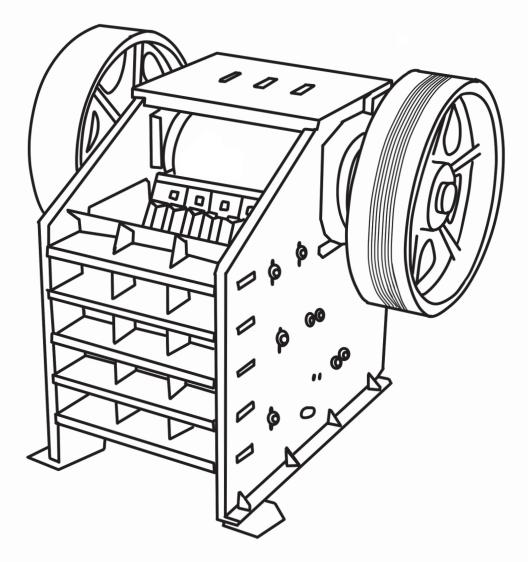

Many materials can be crushed using an IMPACTOR. An impactor's rotor can spin around hundreds of times per minute. The rocks collide with the rotor, fracturing it down into smaller pieces.

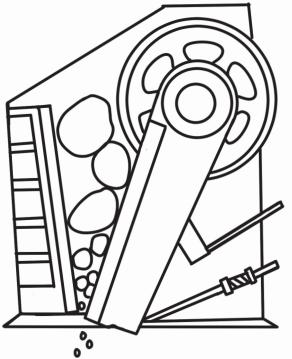

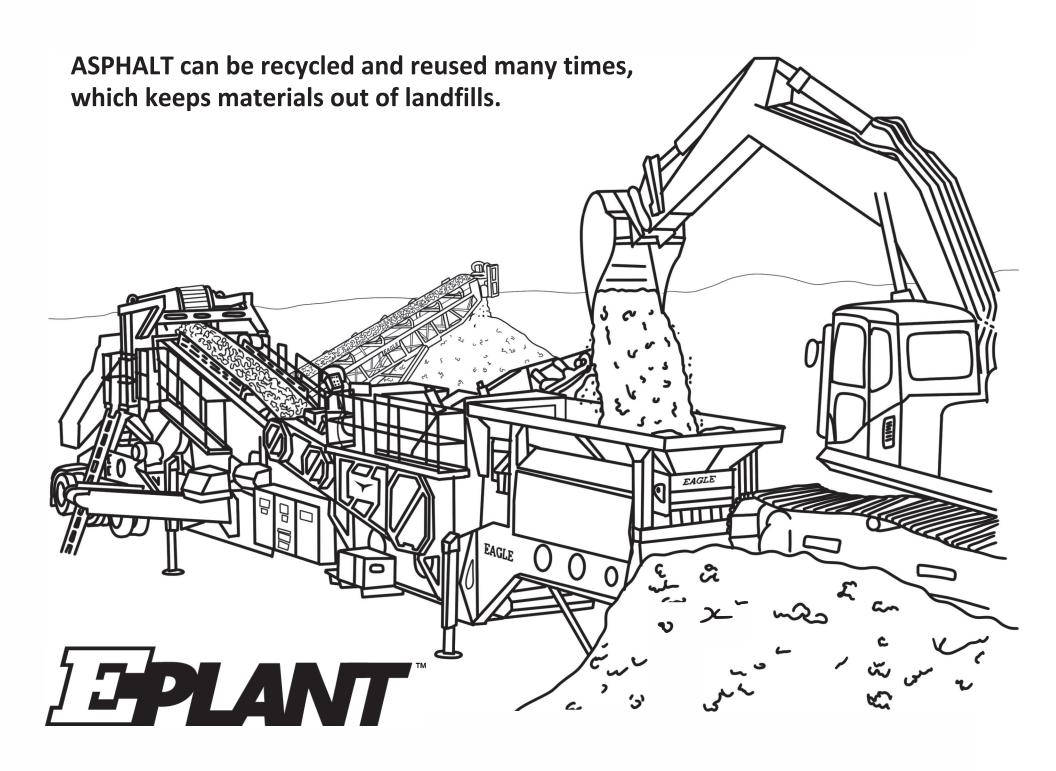

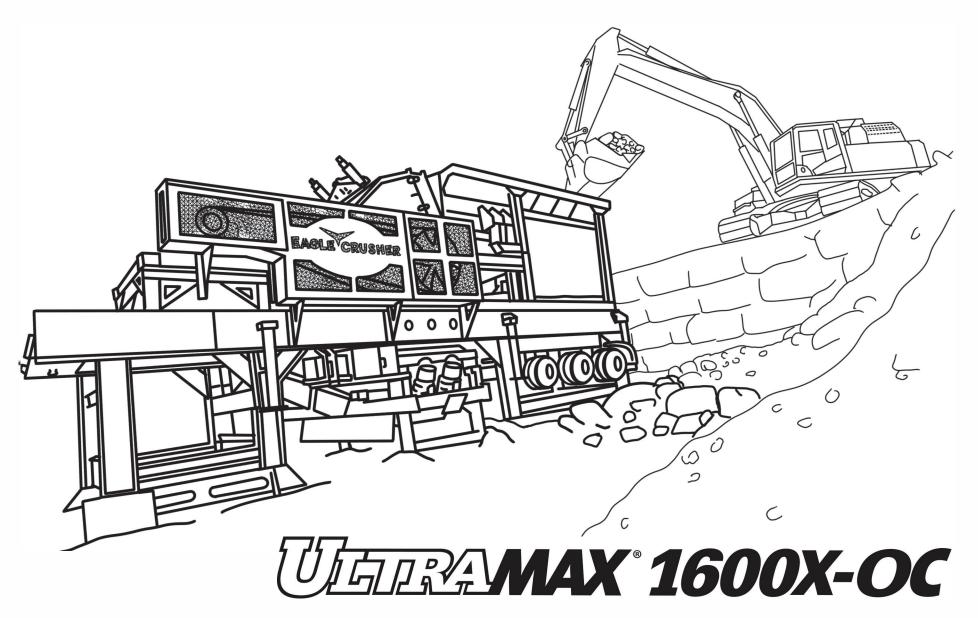

Another way materials can be broken down is by using a JAW crusher. Jaw crushers squeeze the material together with a lot of force until it breaks. Once the material is small enough it can pass through the bottom.

TATO CRUSHERS

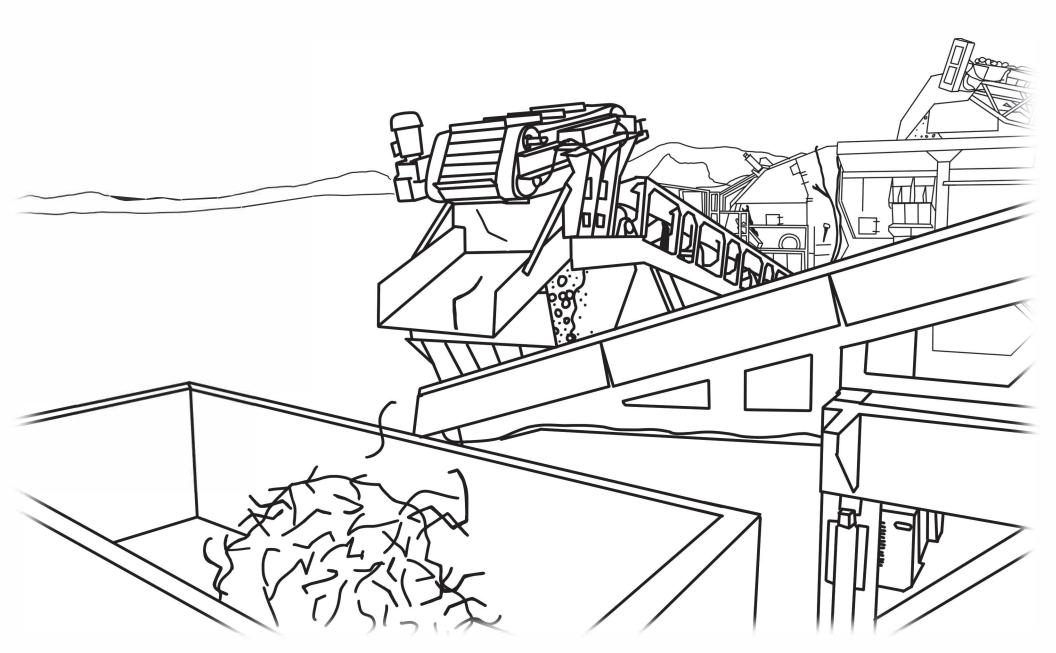

Different types of rocks can be crushed. The most common kinds are limestone sandstone, and granite. Other types can include volcanic rock, basalt, and quartz.

When concrete is recycled, it can still have metal, called rebar, inside in the concrete. That's why some crushers have MAGNETS on the conveyors - to separate the crushed concrete from the rebar.

Help the rock get through the crusher.
